Nobody Tells You This

The leak is inside your own front office

Dialogue only · 141 words · about 55 seconds

Nobody tells you this: your biggest referral problem isn't GPs who stop sending cases. It's inside your own front office.

A voicemail nobody returns. A status clicked by accident. A coordinator who quits and takes every follow-up with them. That quietly costs specialists tens of thousands in lost production every month.

Tooth Referral fixes the leak. It isn't another web form. It's one shared referral network: you and your referring offices work in the same dashboard. Every case, X-ray and message syncs between both offices, with no access codes and no portal links. Every call and voicemail is visible to your whole team, so anyone can pick up any case.

And here's the math: one referral that doesn't leak pays for the whole system.

Setup takes about five minutes. Check out Tooth Referral, and stop the leak inside your own office.

This Will Cost You Money

Staff turnover and the ROI, shown three ways

Dialogue only · 152 words · about 60 seconds

This will cost you money: when your front desk turns over, your referral pipeline walks out the door with them.

Missed voicemails. Follow-ups nobody remembers. A case marked Scheduled that was never booked. Most specialists lose tens of thousands in production every month this way, and never see it.

Tooth Referral is an agentic referral pipeline. Every referral, call and voicemail lives in one dashboard your whole team shares, so a new hire can pick up any case on day one. And a case can't move to Scheduled without a real appointment behind it.

Now the return. One new referral pays for the system. One referral saved from leaking pays for it. One case that would have been lost when an employee left pays for the software for an entire year.

It sets up in about five minutes. Check out Tooth Referral, and keep your referral revenue, even when your staff changes.

You Weren't Supposed To See This

One shared network instead of portals

Dialogue only · 140 words · about 55 seconds

You weren't supposed to see this: what your referring GP goes through just to get an update from you.

A portal link. An access code. Another code next week, just to check on one implant. Portals treat your referring doctors like outsiders.

Tooth Referral puts you and your GPs on the same platform. Each office logs into its own dashboard, and when a case is sent, it syncs to both instantly. Messages, X-rays and appointment updates go straight into the GP's patient feed. Think Slack, built only for dental referrals.

Here's why it pays: GPs don't leave specialists over clinical skill. They leave over silence. Keep them updated, and they keep sending cases. One extra referral pays for the whole system.

Setup takes about five minutes. Check out Tooth Referral, and give your GPs a reason to send you everything.

Never Ever

Built for sale: a transferable asset, not a web form

Dialogue only · 142 words · about 56 seconds

Never ever let your referrals depend on one person's memory if you want your practice to be worth more when you sell.

Buyers and DSOs discount practices that break when the front desk coordinator leaves. And that referral form on your website? It's just a digital fax machine. Nobody makes sure the case gets booked.

Tooth Referral replaces it with a referral pipeline that keeps running on its own. Every case is tracked from received, to scheduled, to returned for restorative care, and your GPs get each update in seconds. Every touchpoint is logged, so the pipeline is auditable and transfers to a buyer. That's an asset, not a form.

It pays today, too: one referral that doesn't slip through pays for the whole system.

Setup takes about five minutes. Check out Tooth Referral, and build a referral system you can sell.
